100,000-foot grids based on Idaho coordinate system,
central and west zones

NATIONAL GEOGRAPHIC VERTICAL DATUM OF 1929
1965 MAGNETIC DECLINATION VALUES FOR THIS SHEET FROM 16°30' EASTERLY FOR THE CENTER OF THE WEST
EDGE TO 18°00' FOR THE CENTER OF THE EAST EDGE. MEAN ANNUAL CHANGE IS 5' WESTERLY

RESOURCE POTENTIAL FOR REPLACEMENT DEPOSITS OF BASE AND PRECIOUS METALS IN THE CHALLIS 1° × 2° QUADRANGLE, IDAHO

By
Frederick S. Fisher and Kathleen M. Johnson
1995

EXPLANATION OF RESOURCE POTENTIAL	
Area having resource potential for replacement deposits of base and precious metals—See table 30 for scoring of recognition criteria	
10	High potential—Areas 10-12
3	Moderate potential—Areas 3, 5, 9
4	Low potential—Areas 2, 6-8, 13-15
1	Area having no potential for replacement deposits of base and precious metals—Area 1
x4	Mine or prospect
1	Pacific
2	Beardsley
3	Excelsior
4	Riverview
5	Red Bird
6	South Butte
7	Clayton Silver

LIST OF GEOLOGIC TERRANES

al	Alluvial terrane
pl	Eocene Plutonic terrane
vo	Challis volcanic terrane
ba	Idaho batholith terrane
bs	Black shale terrane
ca	Carbonate terrane
ms	Proterozoic terrane
	Trans-Challis fault system terrane
	Regions of overlap between carbonate terrane and black shale terrane
	Mostly rock glaciers; alluvial fans; landslide debris; talus; and terminal, end, and lateral moraines. Also includes Miocene volcanic and sedimentary rocks and noncarbonate roof pendants in the Idaho batholith of undivided (Paleozoic? or Proterozoic?) age
	Terrane boundary
	Boundaries of calderas and other volcano-tectonic structures—Dashed where approximately located

DEFINITIONS OF RESOURCE POTENTIAL

High mineral resource potential exists in areas where geologic, geochemical, and geophysical characteristics favorable for resource accumulation are known to be present, or where enough of these characteristics are present to give strong support to genetic models favorable for resource accumulation and where evidence shows that mineral concentration—mineralization in the broad sense—has taken place (Taylor and Steven, 1983, p. 1269).

Moderate mineral resource potential exists in areas where geologic, geochemical, and geophysical characteristics favorable for resource accumulation are likely or can reasonably be inferred to be present but where evidence for mineralization is less clear or has not yet been found (Taylor and Steven, 1983, p. 1269).

Low mineral resource potential exists in areas where geologic, geochemical, and geophysical characteristics are unfavorable, where evidence indicates that mineral concentrations are unlikely, or where requirements for genetic models cannot be supported (Taylor and Steven, 1983, p. 1269).

Unknown mineral resource potential exists in areas where knowledge, at an appropriate scale, is inadequate that to classify potential as high, moderate, or low would be misleading (Taylor and Steven, 1983, p. 1269).

In some instances an assignment of **no mineral resource potential** for a particular ore deposit type or types has been given to specific areas within the Challis quadrangle. In these cases the occurrence of the particular ore deposit type is dependent on the presence of a specific lithology. Known absence of the required rock type precludes the occurrence of the ore deposit.
